At its simplest, Aerohive interrogates a wireless client, and if it's identified as an Apple device that doesn't have the JAMF agent installed, it's forwarded to the proper place for remediation. Non-Apple devices still get handled by Aerohive's native checking capabilities, but the JAMF integration takes the Apple device management to a highly functional level geared specifically at iDevices.

I began writing this book as an introduction to the world of networking for new Network Engineers. After a few years on the job, I wanted to compile all of my notes, thoughts, and knowledge in a form that could help out others just starting their careers. I entered my first job with a certain degree of confidence in my knowledge from taking multiple Cisco exams and perhaps an even greater amount of humility about what I didn't know. This work is dedicated to the new guy on the job. It's intended as a hand reference to double check what's been done and to provide helpful hints and advice on how to solve typical problems. It's aiming to cover the topics on the exams that I found critical in my career, and especially covering the things the exams never prepared me for. It assumes some knowledge of basic networking concepts such as IPv4 addressing, subnetting, and the OSI model. The goal is to present this information in an accessible and easy to understand manner, in contrast with other sources such as exam study material or Cisco documentation. It can be used as a reference for code examples, or read cover to cover to familiarize yourself with many topics. Included are many practical labs and configuration examples. I encourage you to build them out, test them, and expand upon them to increase your knowledge.The book is loosely organised into sections covering basic configuration, managing routers and switches, advanced configurations, switching, routing, WAN technologies, and security concepts. Feel free to jump to those you are most interested in or find most useful.

With the paradigm shift to student-centered learning, thephysical teaching space is being examined The configuration ofclassrooms, the technology within them, and the behaviors theyencourage are frequently represented as a barrier to enactingstudent-centered teaching methods, because traditionally designedrooms typically lack flexibility in seating arrangement, areconfigured to privilege a speaker at the front of the room, andlack technology to facilitate student collaboration. But many colleges and universities are redesigning the spaces inwhich students learn, collapsing traditional lecture halls and labsto create new, hybrid spaces—large technology-enrichedstudios—with the flexibility to support active andcollaborative learning in larger class sizes. With this change, ourclassrooms are coming to embody the 21st-century pedagogy whichmany educators accept, and research and teaching practice arebeginning to help us to understand the educational implications ofthoughtfully engineered classrooms—in particular, that spaceand how we use it affects what, how, and how much studentslearn. This is the 137th volume of this Jossey-Bass higher educationseries. It offers a comprehensive range of ideas and techniques forimproving college teaching based on the experience of seasonedinstructors and the latest findings of educational andpsychological researchers.

The initial plans for this book sprang from a late-afternoon conversation in a hotel bar. All three authors were attending the 1996 meeting of the Population Association of America in New Orleans. While nursing drinks and expounding on a variety of topics, we began talking about our current research projects. It so happened that all three of us had been entertaining the notion of writing a book on state and local population projections. Recognizing the enormity of the project for a single author, we quickly decided to collaborate. Had we not decided to work together, it is unlikely that this book ever would have been written. The last comprehensive treatment of state and local population projections was Don Pittenger ' s excellent work *Projecting State and Local Populations* (1976). Many changes affecting the production of population projections have occurred since that time. Technological changes have led to vast increases in computing power, new data sources, the development of GIS, and the creation of the Internet. The procedures for applying a number of projection methods have changed considerably, and several completely new methods have been developed.
