158 Chapter 5 Integration and Its Applications 53. $f(x) = x^2 + 1$, $\int_1^2 (x^2 + 1) dx = \frac{1}{3}x^3 + x$ evaluated from 1 to 2 gives $\frac{8}{3} + 2 - (\frac{1}{3} + 1) = \frac{7}{3} + 1 = \frac{10}{3}$.
55. At Thus, $y = 5x^2 + 2$, $\int_0^2 (5x^2 + 2) dx = \frac{5}{3}x^3 + 2x$ evaluated from 0 to 2 gives $\frac{20}{3} + 4 = \frac{28}{3}$.
57. At which implies that Thus, $\int_0^4 (4x^2 + 10) dx = \frac{4}{3}x^3 + 10x$ evaluated from 0 to 4 gives $\frac{256}{3} + 40 = \frac{356}{3}$.
59. Since we know that Thus,

If $f(x)$ is a function defined on an interval $[a, b]$, the definite integral of f from a to b is given by. (Chapter 5.1) $\int_a^b f(x) dx = \lim_{n \rightarrow \infty} \sum_{i=1}^n f(x_i) \Delta x$, provided the limit exists. If this limit exists, the function $f(x)$ is said to be integrable on $[a, b]$, or is an integrable function. The numbers a and b are called the limits of integration; specifically, a is the lower limit and b is the upper limit.

Chapter 5 Integration. Chapter 5 Integration. 5.1 Definition. Given a function $f(x)$ (called the integrand) defined on a closed interval $[a,b]$, the (definite) integral $\int_a^b f(x)dx$ of f over $[a,b]$ is the area of the (x,y) plane bounded by the graph of f , the x axis and the vertical lines $x = a$, $x = b$, where areas above and below the x axis count as being positive and negative respectively.

Integration by Parts and Its Applications Chapter 5. Integration. Section 5.1. Antidifferentiation: The indefinite integral Definition: A function $F(x)$ is an antiderivative of $f(x)$ if $F'(x) = f(x)$. The process of finding antiderivative is called antidifferentiation or indefinite integration. Fundamental property of antiderivatives: Chapter 5. Integration.

At its heart, (using the notation of Theorem 5.5.1) substitution converts integrals of the form $\int f(g(x))g'(x)dx$ into an integral of the form $\int f(u)u'$ with the substitution of $u = g(x)$. The following theorem states how the bounds of a definite integral can be changed as the substitution is performed.

This extensive integration of the supply chain can be viewed as a shift from vertical corporate integration to a virtually integrated corporation (Magretta, 1998). Vertical integration was essential in the early years of computer manufacturing when the supplier base was not well established and assemblers had little choice but to design and build components and assemble the entire end product ...

Numerical Integration Schemes Abstract. The calculation of the call price in the Heston model often requires the evaluation of an integral. This is true for most of the formulations of the call price we have encountered, that by Heston (1993), Lewis (2000, 2001), Carr and Madan (1999), or Attari (2004).
