Make sure you are thoroughly prepared to work in a clinical lab. Rodak's Hematology: Clinical Principles and Applications, 6th Edition uses hundreds of full-color photomicrographs to help you understand the essentials of hematology. This new edition shows how to accurately identify cells, simplifies hemostasis and thrombosis concepts, and covers normal hematopoiesis through diseases of erythroid, myeloid, lymphoid, and megakaryocytic origins. Easy to follow and understand, this book also covers key topics including: working in a hematology lab; complementary testing areas such as flow cytometry, cytogenetics, and molecular diagnostics; the parts and functions of the cell; and laboratory testing of blood cells and body fluid cells. UPDATED nearly 700 full-color illustrations and photomicrographs make it easier for you to visualize hematology concepts and show what you'll encounter in the lab, with images appearing near their mentions in the text to minimize flipping pages back and forth. UPDATED content throughout text reflects latest information on hematology. Instructions for lab procedures include sources of possible errors along with comments. Hematology instruments are described, compared, and contrasted. Case studies in each chapter provide opportunities to apply hematology concepts to real-life scenarios. Hematology/hemostasis reference ranges are listed on the inside front and back covers for quick reference. A bulleted summary makes it easy for you to review the important points in every chapter. Learning objectives begin each chapter and indicate what you should achieve, with review questions appearing at the end. A glossary of key terms makes it easy to find and learn definitions. NEW! Additional content on cell structure and receptors helps you learn to identify these organisms. NEW! New chapter on Introduction to Hematology Malignancies provides and overview of diagnostic technology and techniques used in the lab.

Textbook explores key aspects of hematology from normal hematopoiesis through diseases of erythroid, myeloid, lymphoid, and megakaryocytic origin. Includes a revised section on hemostasis and thrombosis. Case studies and chapter summaries are included.

The purpose of this text is to present a complete hematology course for Clinical Laboratory Science (CLS) students, as well as to provide a resource for clinical laboratory practitioners, medical students, and residents. It presents an in-depth study of cell counting, morphologic differentiation and evaluation, and related areas, such as flow cytometry, immunohistochemistry, and cytogenetics. A chapter on specific age groups covers the unique aspects of hematology in the pediatric and geriatric populations. A section on the etiology and treatment of leukocyte neoplasms has been included to provide some insight into the special considerations of oncologic disorders. Chapters begin with an outline and learning objectives, and color figures are presented as close to the citation as possible to facilitate understanding of the discussion. Most chapters end with a summary, and in many cases, review questions or case studies are included to assess or reinforce understanding of the material.

Blood Cells has been written with both the practising haematologist and the trainee in mind. It aims to provide a guide for use in the diagnostic haematology laboratory, covering methods of collection of blood specimens, blood film preparation and staining, the principles of manual and automated blood counts and the assessment of the morphological features of blood cells. The practising haematologist should find this book sufficiently comprehensive to be a reference source while, at the same time, the trainee haematologist and biomedical scientist should find it a straightforward and practical bench manual. Enables both the haematologist and laboratory scientist to identify blood cell features, from the most common to the more obscure Provides essential information on methods of collection, blood film preparation and staining, together with the principles of manual and automated blood counts Completely revised and updated, incorporating much newly published information: now includes advice on further tests when a specific diagnosis is suspected Four hundred high quality photographs to aid with blood cell identification Highlights the purpose and clinical relevance of haematology laboratory tests throughout

This book covers recent advances in the understanding and management of essential hematological pathologies. In addition to updates on Hodgkin's lymphoma, acute myeloid leukemia and other disorders, it provides essential information on transplant pathology, and the molecular and genetic aspects of hematological disorders. Offering a practical approach to lymphoma diagnosis, the book will help hematologists and pathologists alike make accurate diagnoses in keeping with the latest classifications and methodologies. A wealth of photographs and algorithms help readers understand the laboratory approach to the diagnosis of hematological disorders, reflecting the latest advances in the field. The book offers a valuable resource for residents of MD pathology, DM hematopathology and clinical hematology, as well as practitioners of hematology.

This book focuses on hematopoietic and lymphoid neoplasms that initially present as peripheral blood abnormalities, with either cytopenias or elevated peripheral blood counts, as well as non-neoplastic conditions that may raise concern for a hematologic malignancy. The scope of the book includes myelodysplastic syndromes (MDS), myeloproliferative neoplasms (MPN), mixed myelodysplastic/myeloproliferative neoplasms (MDS/MPN), as well as lymphomas and lymphoid leukemias that typically present initially with peripheral blood abnormalities. Within each category, a comprehensive list of differential diagnoses is discussed. For each disease entity, the reader is updated with new molecular genetic data, biomarkers, and recent applications of immunophenotyping, and how to incorporate the new information in disease diagnosis and classifications is illustrated, including the use of diagnostic algorithms where appropriate. The book employs the revised WHO Classification of Hematopoietic Neoplasms for all disease entities. Diagnosis of Blood and Bone Marrow Disorders will serve as a very useful resource for pathologists, pathologists in training, hematologists and medical technologists who are involved in the clinical work-up of patients with bone marrow and blood neoplasms. It will provide a practical and concise yet comprehensive review.

A concise and thorough guide to clinical hematology and the fundamentals of hemostasis. The text's five parts provide a substantial introduction to the subject, followed by sections on the anemias, white blood cell disorders, hemostasis/thrombosis, and laboratory methods. This edition includes new chapters addressing the use of flow cytometry, the molecular diagnostic techniques in hematopathology, and an introduction to thrombosis and anticoagulant therapy. A feature of previous editions, a 260-page color-plate atlas, has been incorporated throughout the text. Annotation copyright by Book News, Inc., Portland, OR

Expertly edited and endorsed by the International Society for Laboratory Hematology, this is the newest international textbook on all aspects of laboratory hematology. Covering both traditional and cutting-edge hematology laboratory technology this book emphasizes international recommendations for testing practices. Illustrative case studies on how technology can be used in patient diagnosis are included. Laboratory Hematology Practice is an invaluable resource for all those working in the field.
